-- The MAILING DATE of this communication appears on the cover sheet with the correspondence address.--

Period for Reply

A SHORTENED STATUTORY PERIOD FOR REPLY IS SET TO EXPIRE 3 MONTH(S) OR THIRTY (30) DAYS, WHICHEVER IS LONGER, FROM THE MAILING DATE OF THIS COMMUNICATION.

- Extensions of time may be available under the provisions of 37 CFR 1.136(a). In no event, however, may a reply be timely filed after SIX (6) MONTHS from the mailing date of this communication.
- If NO period for reply is specified above, the maximum statutory period will apply and will expire SIX (6) MONTHS from the mailing date of this communication.
- Failure to reply within the set or extended period for reply will, by statute, cause the application to become ABANDONED (35 U.S.C. § 133). Any reply received by the Office later than three months after the mailing date of this communication, even if timely filed, may reduce any earned patent term adjustment. See 37 CFR 1.704(b).

Status

- 1) ☒ Responsive to communication(s) filed on 23 April 2007.
- 2a) ☐ This action is **FINAL**. 2b) ☒ This action is non-final.
- 3) ☐ Since this application is in condition for allowance except for formal matters, prosecution as to the merits is closed in accordance with the practice under *Ex parte Quayle*, 1935 C.D. 11, 453 O.G. 213.

Disposition of Claims

- 4) ☒ Claim(s) 1-15 is/are pending in the application.
- 4a) Of the above claim(s) _____ is/are withdrawn from consideration.
- 5) ☐ Claim(s) _____ is/are allowed.
- 6) ☒ Claim(s) 1-15 is/are rejected.
- 7) ☐ Claim(s) _____ is/are objected to.
- 8) ☐ Claim(s) _____ are subject to restriction and/or election requirement.

Application Papers

- 9) ☐ The specification is objected to by the Examiner.
- 10) ☐ The drawing(s) filed on _____ is/are: a) ☐ accepted or b) ☐ objected to by the Examiner.
Applicant may not request that any objection to the drawing(s) be held in abeyance. See 37 CFR 1.85(a).
Replacement drawing sheet(s) including the correction is required if the drawing(s) is objected to. See 37 CFR 1.121(d).
- 11) ☐ The oath or declaration is objected to by the Examiner. Note the attached Office Action or form PTO-152.

Priority under 35 U.S.C. § 119

- 12) ☐ Acknowledgment is made of a claim for foreign priority under 35 U.S.C. § 119(a)-(d) or (f).
- a) ☐ All b) ☐ Some * c) ☐ None of:
- ☐ Certified copies of the priority documents have been received.
 - ☐ Certified copies of the priority documents have been received in Application No. _____.
 - ☐ Copies of the certified copies of the priority documents have been received in this National Stage application from the International Bureau (PCT Rule 17.2(a)).

* See the attached detailed Office action for a list of the certified copies not received.

DETAILED ACTION

Continued Examination Under 37 CFR 1.114

A request for continued examination under 37 CFR 1.114, including the fee set forth in 37 CFR 1.17(e), was filed in this application after final rejection. Since this application is eligible for continued examination under 37 CFR 1.114, and the fee set forth in 37 CFR 1.17(e) has been timely paid, the finality of the previous Office action has been withdrawn pursuant to 37 CFR 1.114. Applicant's submission filed on 4/23/07 has been entered.

Response to Arguments

Applicant's arguments with respect to independent claims 1, 8, and 15 have been fully considered but they are not persuasive.

In the present application, Applicant essentially argues that Rosen et al. (US 2002/0173326 A1) fails to teach a "push-to-talk" initialization request or a "push-to-talk announce message" from a calling handset, because the current claims define such a request as identifying a recipient handset, which currently has no communication links with the calling handset. Further, the Applicant argues that Rosen fails to teach a communicative link that is established between the calling handset and the recipient, where none existed before.

Examiner respectfully disagrees. The proposed amendments to claim 1 states "... identifying a recipient handset currently having no communicative links with the calling handset and establishing a communicative link between the calling handset and the recipient handset." The current claim language teaches a push-to-talk initialization that is occurring at that very moment; the claim language does not specify about any communicative links that did not exist

before (as the Applicant argues in the Remarks) or any previous communicative links. Rosen discloses that "the means for requesting the transmission privilege from a CM comprises a push-to-talk key or switch. When a user desires to transmit information to other net members, the user may depress the push-to-talk switch located on his or her communication device (read as initializing request identifying a recipient handset), sending a floor-control request to obtain the transmission privilege from CM...After the requesting user has been granted the transmission privilege, information may then be transmitted from that user to the other net member (read as recipient handset)." (paragraph 32) When a user wants to transmit information to other net members, the user pushes the switch on his/her device, i.e. he/she is initializing a request identifying a recipient handset. It is clear that the push-to-talk call is not already established. In addition, Rosen et al disclose that the method includes triggering each of the communication devices to re-establish a traffic channel (abstract, paragraph 12). In other words, the triggering of each communication device is being initialized because currently, the dedicated traffic channel has not been established.

Furthermore, the Applicant argues even if Rosen re-establishes a traffic channel, it is done so in a scenario that does not cover the present claims because the NBS media signaling channel 212 and the SIP channel 210 are already established communicative links between the two devices. In the present claims, however, there is no communicative link at all between the sending and receiving devices.

Examiner respectfully disagrees. As discussed above, the current claim language teaches a push-to-talk initialization that is occurring at that very moment; the claim language does not specify about any communicative links that did not exist before (as the Applicant argues in the

Remarks) or any previous communicative links. Rosen discloses that the SIP channel 210 and NBS media signaling channel 212 (figure 2) may be used at any time as bandwidth allows by any of the communication devices, regardless of being designated a talker or a listener. (figure 2, paragraph 44) In one embodiment, SIP channel is used to start and end (*when the SIP channel has been started, this can be read as establishing a communicative link and when the SIP channel has ended, this can be read as having no communicative links*) participation of a communication device within the NBS net. When the communication devices participation is setup, i.e. by using the SIP channel, real time control and signaling takes place. In one embodiment, NBS media signaling channel is used, among other things, to handle push-to-talk requests and releases and announce the beginning and end of information transmission. (paragraph 45)

Furthermore, Rosen discloses that when a first net member wishes to transmit information to other net members of the net, the first net member may request the transmission privilege by pressing a push-to-talk key on his or communication devices, which generates a request formatted for transmission over the distributed network. (paragraph 36) If the channel has already been establish which essentially means that there is no communicative link at all between the sending and receiving devices, as the Applicant argues, there would be no need for the first net member to request the transmission privilege. As discussed earlier, the SIP channel used in Rosen is used to start and end participation of a communication device.

Amended independent claims 8 and 15 recite similar features of independent claim 1. The recited claim language is given the broadest reasonable interpretation. As a result, the argued features are written such that they read upon the cited references; therefore the Rosen

(US 2002/0173326 A1) and Black (US 2004/0057405) references still apply to the present application.

Claim Rejections - 35 USC § 102

The following is a quotation of the appropriate paragraphs of 35 U.S.C. 102 that form the basis for the rejections under this section made in this Office action:

A person shall be entitled to a patent unless –

(b) the invention was patented or described in a printed publication in this or a foreign country or in public use or on sale in this country, more than one year prior to the date of application for patent in the United States.

Claims 1-4, 6-11, 13, and 14 are rejected under 35 U.S.C. 102(b) as being anticipated by **Rosen et al (United States Patent Application Publication #2002/0173326 A1)**.

Consider **claim 1**, Rosen et al clearly show and disclose a method for initializing a push-to-talk call over a wireless communication network, comprising:

receiving via a wireless communication network (fig 1, paragraph 24; Group communication system 100, which is known as a push-to-talk system), a push-to-talk initialization request from a calling handset, the request identifying a recipient handset currently having no communication links with the calling handset; (figure 2; abstract; paragraphs 12, 32, 36, and 45; Requesting the transmission privilege from a communication manager comprises a push-to-talk key or switch. When a user desires to transmit information to other net members, the user may depress the push-to-talk switch located on his or her communication device. After the requesting user has been granted the transmission privilege, information may then be transmitted from that user to the other net member);

establishing a communicative link between the calling handset and the recipient handset (XXXX) , including creating an announce message corresponding to the push-to-talk initialization request; (paragraphs 36-37; When receiving a transmission privilege request, the CM transmits a message to the requesting net member (read as announce message) notifying it that the transmission privilege has been granted);

addressing the announce message to the recipient handset (paragraph 32; After the requesting user has been granted the transmission privilege, information may then be transmitted from that user to the other net member);

broadcasting the announce message over the wireless communication network, wherein the announce message is transmitted over a plurality of base stations (fig. 1; paragraph 33; Each wireless net member establishes a forward link and a reverse link with one or more base stations or a satellite gateway);

receiving via one of the plurality of base stations an acknowledgement message in response to the announce message (paragraphs 33-37; When the communication manager receives a transmission privilege request, the control manager may transmit a message to the requesting net member, notifying it that the transmission privilege has been granted); and

transmitting a connection status message to the calling handset to instruct the calling handset to open an audio channel in response to receiving the acknowledgement message (paragraphs 33-37; When a first net member wishes to transmit information to other members of the net, the first net member may request the transmission privilege by pushing a PTT key on the device, generating a request for transmission. A message is then transmitted to the target handset in order for audio information to be transmitted to other net members.).

Consider **claim 8**, Rosen et al clearly show and disclose a system for initializing a push-to-talk call over a wireless communication network, comprising:

a target handset configured for over the air communication in a wireless communication network (fig. 1; paragraph 27; Communication occurs using communications devices 102, 104, 106, and 108. Communications devices may be wireless communication devices such as satellite telephones equipped with push-to-talk functionality);

a plurality of base stations configured to communicate over the air with the target handset, wherein a push-to-talk announce message is broadcast to the target handset over the plurality of base stations, the push-to-talk announce message originating from a calling handset currently having no established communicative links with the target handset, the push-to-talk announce message configured to establish a communicative link with the target handset (figure 2; abstract; paragraphs 12, 32, 36, and 45; When a member wishes to transmit information to other members, the first member may request the transmission privilege by pressing a push-to-talk key on his or her communication device, wherein the request may be transmitted over the air to one or more base stations);

wherein a first base station receives an acknowledgement message from the target handset in response to the announce message (paragraph 37; When the communication manager receives a transmission privilege request, the control manager may transmit a message to the requesting net member, notifying it that the transmission privilege has been granted); and

wherein the first base station is configured to open an audio channel in response to the acknowledgement message (paragraphs 33, 37, and 50; Voice and/or data may be converted into

data packets, using a communication device, which are suitable for a particular distributed network through which communications to other users may take place. If the user's packet data call is in the dormant state, the user may be able to receive incoming voice calls).

Consider **claim 2**, and as **applied to claim 1 above**, Rosen et al clearly show and disclose the wireless communication network (read as group communication system) (figure 1, paragraph 24) is a code division multiple access network (paragraphs 26, 40, 65, 84, 89, and 101).

Consider **claim 3**, and as **applied to claim 2 above**, Rosen et al clearly show and disclose the broadcasting step further comprises the announce message in a dedicated physical channel (control channel) (paragraph 65).

Consider **claim 4**, and as **applied to claim 3 above**, Rosen et al clearly show and disclose the control channel is a forward dedicated common control channel (F-DCCH) (paragraph 65).

Consider **claim 6**, and as **applied to claim 1 above**, Rosen et al clearly show and disclose the acknowledgement message is received in a dedicated physical channel (control channel) (paragraph 65).

Consider **claim 7**, and as **applied to claim 6 above**, Rosen et al clearly show and disclose the control channel is a reverse enhanced access channel (R-EACH) (paragraph 65).

Consider **claim 9**, and as **applied to claim 8 above**, Rosen et al clearly show and disclose wireless communication network (read as group communication system) (figure 1, paragraph 24) is a code division multiple access network (paragraphs 26, 40, 65, 84, 89, and 101).

Consider **claim 10**, and as **applied to claim 9 above**, Rosen et al clearly show and disclose a plurality of channels in the wireless communication network (paragraph 65; Messages may be sent over both dedicated physical channels, such as the forward fundamental channel (FCH) or forward dedicated common control channel (F-DCCH), or common physical channels, such as the reverse access channel (R-ACH), reverse enhanced access channel (R-EACH), forward common control channel (F-CCCH), or paging channel (PCH)), wherein the push-to-talk announce message is broadcast to the target handset in a forward dedicated common control channel (F-DCCH) (paragraph 65).

Consider **claim 11**, and as **applied to 8 above**, Rosen et al clearly show and disclose a push-to-talk server, wherein the push-to-talk server initiates the push-to-talk announce message (fig. 1; paragraphs 27 and 32; The communication devices have the ability to request transmission privilege from a communication manager. The communication manager is any type of computer type device having at least one processor and memory. When a user desires to transmit information to other members, the may depress the push-to-talk switch located on his or her communication device, sending a request to obtain the transmission privilege from the control manager).

Consider **claim 13**, and as **applied to claim 8 above**, Rosen et al clearly show and disclose the acknowledgement message is received by the first base station in a dedicated physical channel (control channel) (paragraph 65).

Consider **claim 14**, and as **applied to claim 13 above**, Rosen et al clearly show and disclose the control channel is a reverse enhanced access channel (R-EACH) (paragraph 65).

Claim Rejections - 35 USC § 103

The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negated by the manner in which the invention was made.

The factual inquiries set forth in *Graham v. John Deere Co.*, 383 U.S. 1, 148 USPQ 459 (1966), that are applied for establishing a background for determining obviousness under 35 U.S.C. 103(a) are summarized as follows:

1. Determining the scope and contents of the prior art.
2. Ascertaining the differences between the prior art and the claims at issue.
3. Resolving the level of ordinary skill in the pertinent art.
4. Considering objective evidence present in the application indicating obviousness or nonobviousness.

This application currently names joint inventors. In considering patentability of the claims under 35 U.S.C. 103(a), the examiner presumes that the subject matter of the various claims was commonly owned at the time any inventions covered therein were made absent any evidence to the contrary. Applicant is advised of the obligation under 37 CFR 1.56 to point out the inventor and invention dates of each claim that was not commonly owned at the time a later invention was made in order for the examiner to consider the applicability of 35 U.S.C. 103(c) and potential 35 U.S.C. 102(e), (f) or (g) prior art under 35 U.S.C. 103(a).

Claim 15 is rejected under 35 U.S.C. 103(a) as being unpatentable over **Rosen et al (United States Patent Application Publication #2002/0173326 A1)** in view of **Black (US Patent Application Publication #2004/0057405)**.

Consider **claim 15**, Rosen et al disclose a method for initializing a push-to-talk between a calling handset and a recipient handset call over a wireless communication network, comprising: receiving at a base station via a reverse link channel in a wireless communication network, a push-to-talk initialization request from a calling handset, the request identifying a single recipient handset currently having no communicative links with the calling handset (figure 2; abstract; paragraphs 12, 32-37, and 45; A dedicated reverse link is established in each communication system for broadcasting information from each net member to other net members); establishing a communicative link between the calling handset and the recipient handset (figure 2; abstract; paragraphs 12, 32, 36, and 45); creating at each of the plurality of base stations a control channel (read as reverse or forward common channel) push-to-talk announce message (read as response to the floor-control request) addressed to the recipient handset (paragraphs 33-37, 63); broadcasting the control channel push-to-talk announce message from the plurality of base stations (paragraphs 33-37, 63-65); receiving from the recipient handset an acknowledgement message corresponding to the push-to-talk announce message at a first base station via a reverse link channel (paragraph 37; When receiving a transmission privilege request, the control manager may transmit a message to the requesting net member, notifying it that the transmission privilege has been granted); and opening an audio channel between the calling handset and the recipient handset in response to the acknowledgement message corresponding to the push-to-talk announce message (paragraphs 33-37; When a first net member wishes to transmit information to other members of the net, the first net member may request the transmission privilege by pushing a PTT key on the device, generating a request

for transmission. A message is then transmitted to the target handset in order for audio information to be transmitted to other net members.).

Rosen et al fail to disclose converting the reverse link channel push-to-talk initialization request to an internet protocol push-to-talk initialization request message; sending the internet protocol push-to-talk initialization request message to a push-to-talk server; creating an internet protocol push-to-talk announce message corresponding to the internet protocol push-to-talk initialization request; and sending the internet protocol push-to-talk announce message to a plurality of base stations:

In related art, Black discloses a wireless service for quick one-to-one or one-to-many communication that operates in half-duplex communication using a reverse link. A user presses PTT button on a phone/radio to initiate a group communication. If granted the floor, the user provides media for a short time period. After the user releases the PTT button, other users may request the floor. These services have traditionally been used in applications where one person, a "dispatcher," needs to communicate with a group of people. Similar services have been offered on the Internet and are generally known as "voice chat." (paragraph 4) The system and method for providing group communication services uses a communication device capable of generating data packets suitable for transmission over a data network, such as the Internet. The data packets are transmitted to a data network, and are then provided to a communications manager connected to the data network. The data packets are then processed that it receives from a first device and distributes the data packets to at least one other device. (paragraph 18) Black further teaches that each wireless group member establishes a reverse link with one or base stations. Voice,

Art Unit: 2618

video, and/or data is converted into data packets using a device, the data packets being suitable for Internet. (figures 2 and 3, paragraphs 33, 40)

Therefore, it would have been obvious to one of ordinary skill in the art at the time of the invention to incorporate the Internet protocol teachings of Black into the teachings of Rosen et al to allow the routing of voice conversations over the Internet through an IP-based network.

Conclusion

Any response to this Office Action should be **faxed to (571) 273-8300 or mailed to:**

Commissioner for Patents
